

# Water Futures Under a Changing Climate

Dr Rachael McDonnell  
Head of Climate Change Modeling and Adaptation  
International Center for Biosaline Agriculture

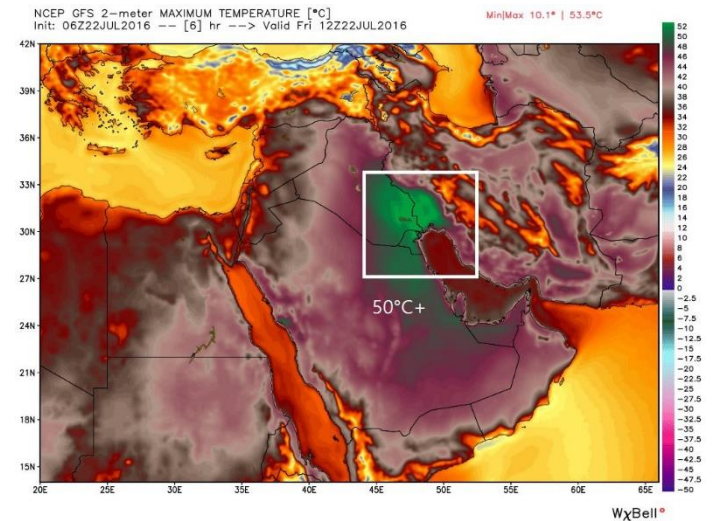

# Overview

- What does climate change modelling tell us about future conditions in the Gulf States?
- What are the possible adaptation solutions?

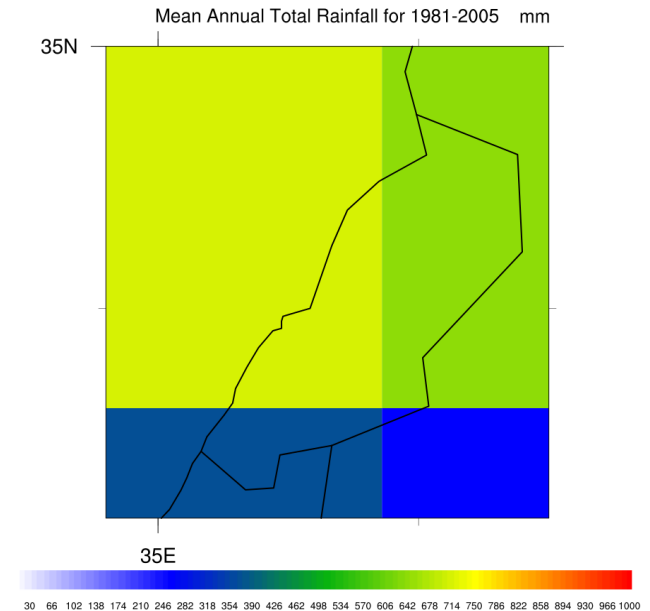

# Introduction

- Gulf states water systems prone to any CC changes that affect supply or increase demand
  - Reduce rainfall and/or bring storm flows
  - Increase air temperature/evapotranspiration
  - Change temperature/salinity of the sea impairing desal
  - Change temperature/salinity affecting treated wastewater processes

# What do climate change models tell us about future conditions in the Gulf States?

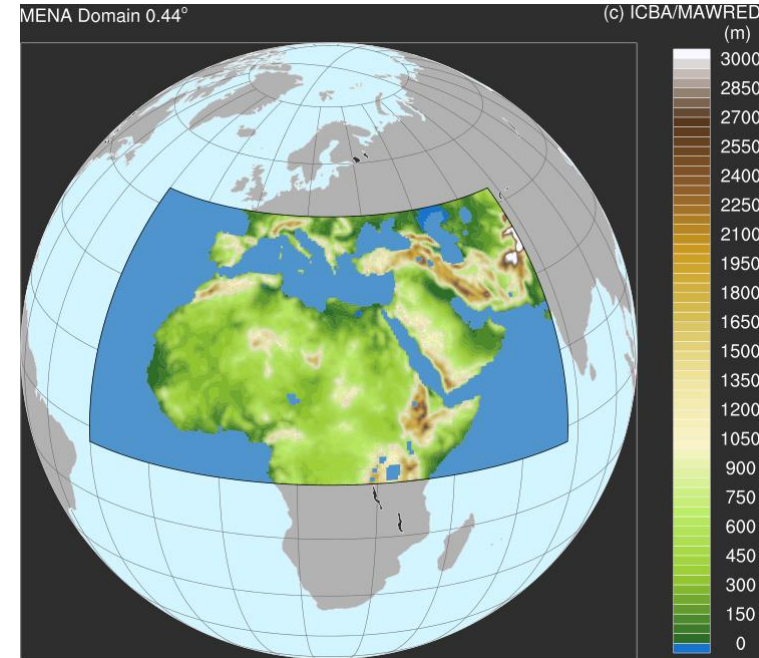

- General Circulation Models (GCMS) captures the global dynamic processes and transfers of energy and moisture
- BUT scale is >150km per grid cell
- Regional climate modeling needed

# Dynamic downscaling at ICBA

- ICBA tuned regional climate model (WRF)
- GCMs: CNRM-CM5, MIROC5 and CESM1 identified as best for MENA

DOMAIN	RESOLUTION
MENA	50 km
UAE / Gulf States Morocco / Tunisia / Yemen /Lebanon / Jordan / Palestine / Egypt /	15 km

(1951 – 2005)

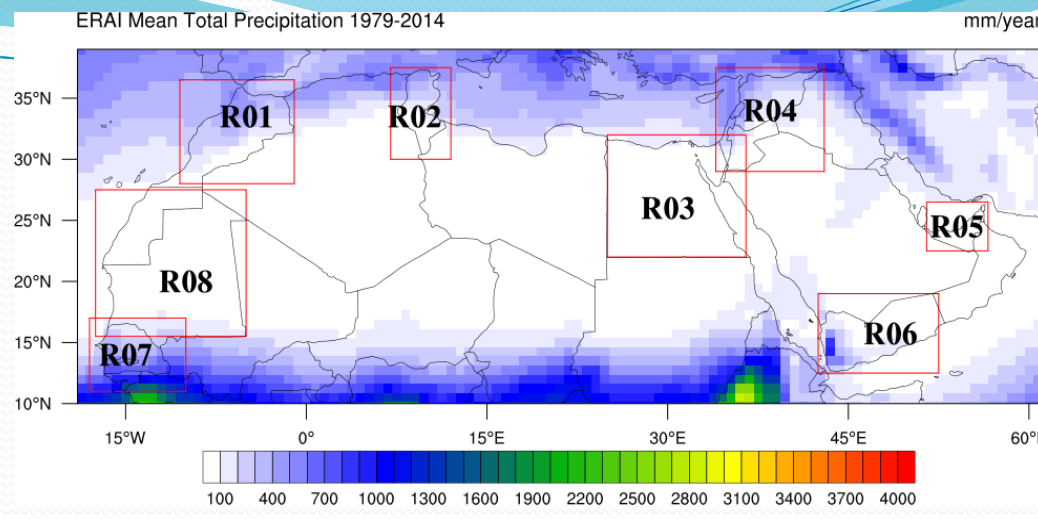

**Current**

(2021 – 2100)

**RCP4.5**

**RCP8.5**

- 13 regional models have been assessed against ERA-Interim on sub-regions including the Gulf states -2m temperature and rainfall have been assessed

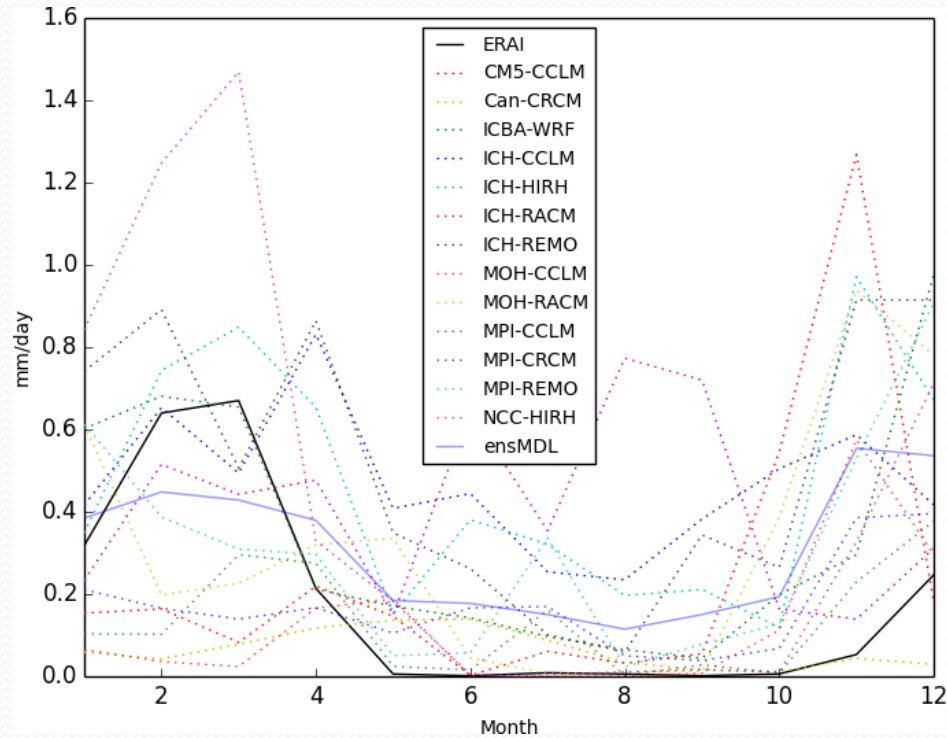

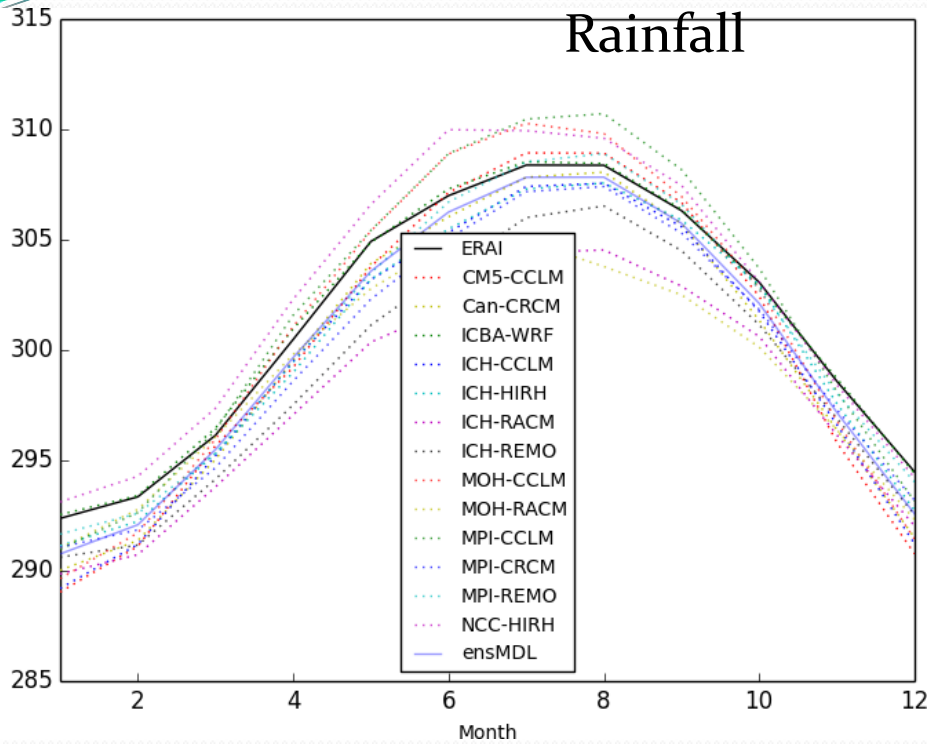

Models assessed

Tool: NASA-JPL RCMES

GCM	RCM
CCCma-CanESM2	UQAM-CRCM5
CNRM-CERFACS-CNRM-CM5	CLMcom-CCLM4-8-17
ICHEC-EC-EARTH	CLMcom-CCLM4-8-17
ICHEC-EC-EARTH	MPI-CSC-REMO2009
ICHEC-EC-EARTH	KNMI-RACMO22T
ICHEC-EC-EARTH	DMI-HIRHAM5
MOHC-HadGEM2-ES	CLMcom-CCLM4-8-17
MOHC-HadGEM2-ES	KNMI-RACMO22T
MPI-M-MPI-ESM-LR	CLMcom-CCLM4-8-17
MPI-M-MPI-ESM-LR	MPI-CSC-REMO2009
MPI-M-MPI-ESM-LR	UQAM-CRCM5
NCAR-CESM1	ICBA-WRF3.6
NCC-NorESM1-M	DMI-HIRHAM5

# Temperature

## Rainfall

- Most models don't reproduce the climatology in the Gulf states in terms of Rainfall
- Some models have cold/hot bias exceeding 5 degrees in summer

Temperature will increase especially over the continental areas

Annual Mean Temperature Change for 2031-2050 Compared to 1986-2005 for RCP4.5

Annual Mean Temperature Change for 2071-2090 Compared to 1986-2005 for RCP4.5

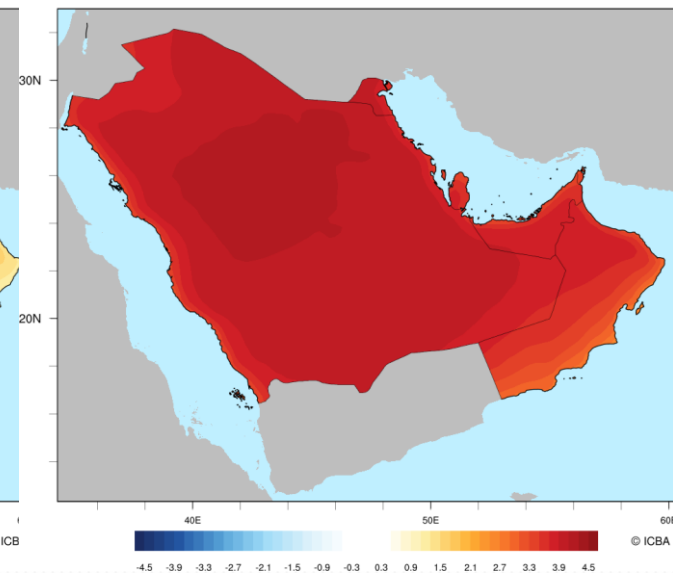

°C

Temperature will likely to increase by more than 4.5 °C under RCP8.5 scenario in central Saudi Arabia by the end of this Century

Annual Mean Temperature Change for 2031-2050 Compared to 1986-2005 for RCP8.5

Annual Mean Temperature Change for 2071-2090 Compared to 1986-2005 for RCP8.5

°C

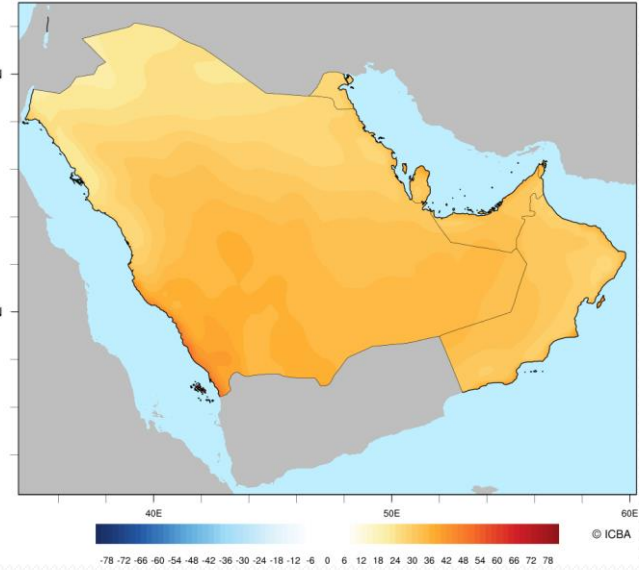

Heat waves frequency will likely to increase by more than 60% under RCP8.5 especially over the costal zones

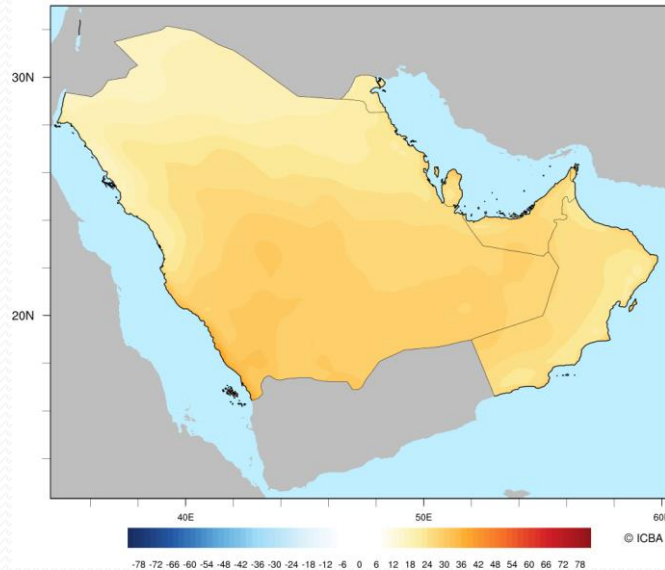

Annual TX90P Change for 2031-2050 Compared to 1986-2005 for RCP4.5

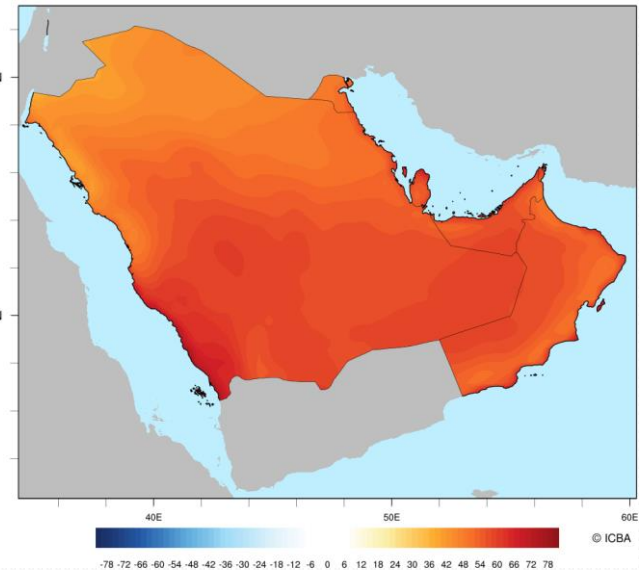

Annual TX90P Change for 2071-2090 Compared to 1986-2005 for RCP4.5

Annual TX90P Change for 2031-2050 Compared to 1986-2005 for RCP8.5

Annual TX90P Change for 2071-2090 Compared to 1986-2005 for RCP8.5

Maximum consecutive dry days will likely to increase by more than 20% under RCP8.5 in GCC countries

Annual CDD Change for 2031-2050 Compared to 1986-2005 for RCP4.5

%

Annual CDD Change for 2071-2090 Compared to 1986-2005 for RCP4.5

%

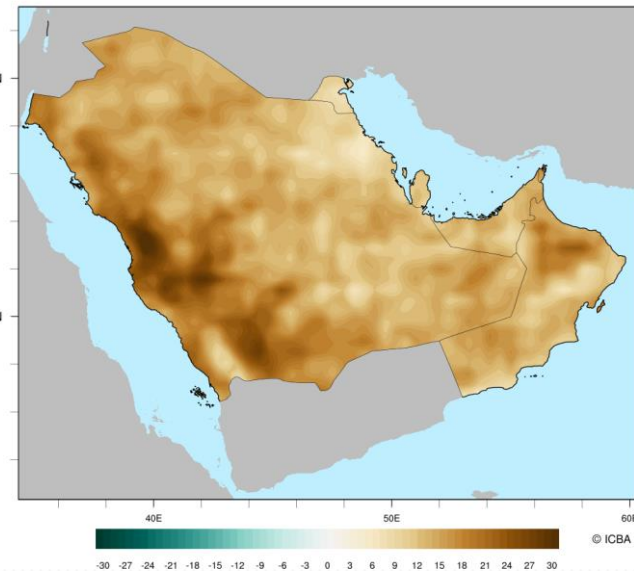

Annual CDD Change for 2031-2050 Compared to 1986-2005 for RCP8.5

%

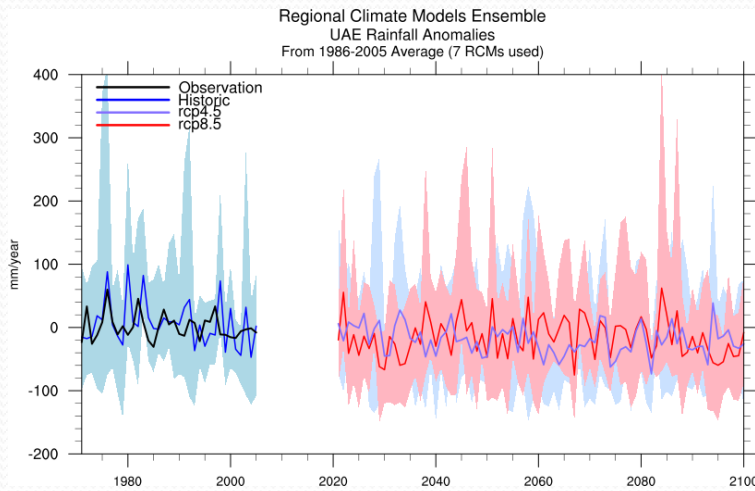

Annual CDD Change for 2071-2090 Compared to 1986-2005 for RCP8.5

%

# Future changes 2071-2090 vs 1986-2005

Drop in rainfall reaching more than 30% by 2100

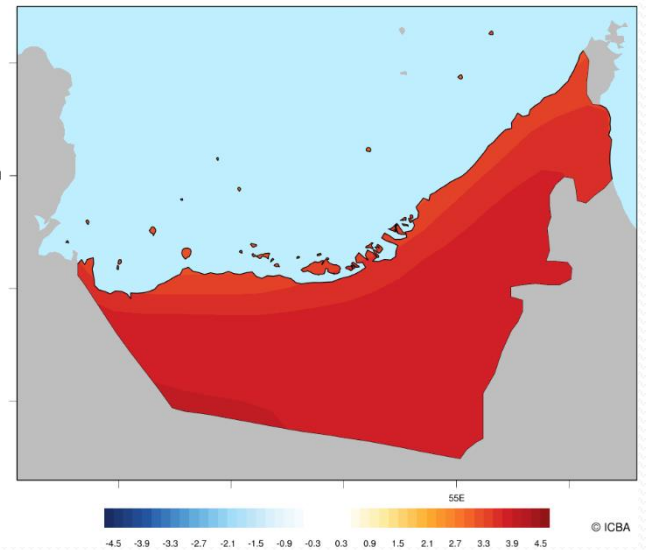

Annual Total Rainfall Change for 2071-2090 Compared to 1986-2005 for RCP8.5

Increase in 2m  
Temperature reaching  
4.5 degrees by 2100

Annual Mean Temperature Change for 2071-2090 Compared to 1986-2005 for RCP8.5

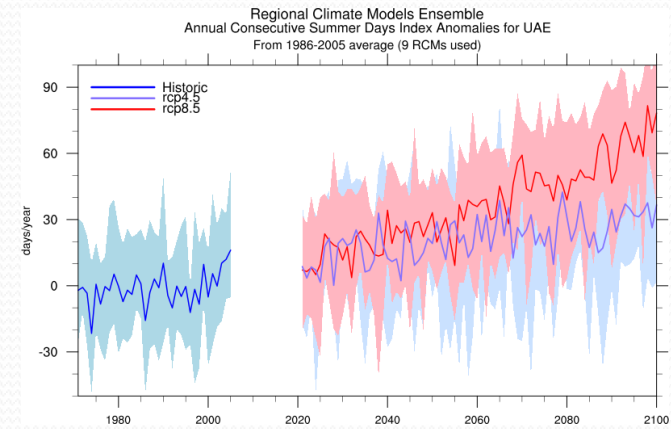

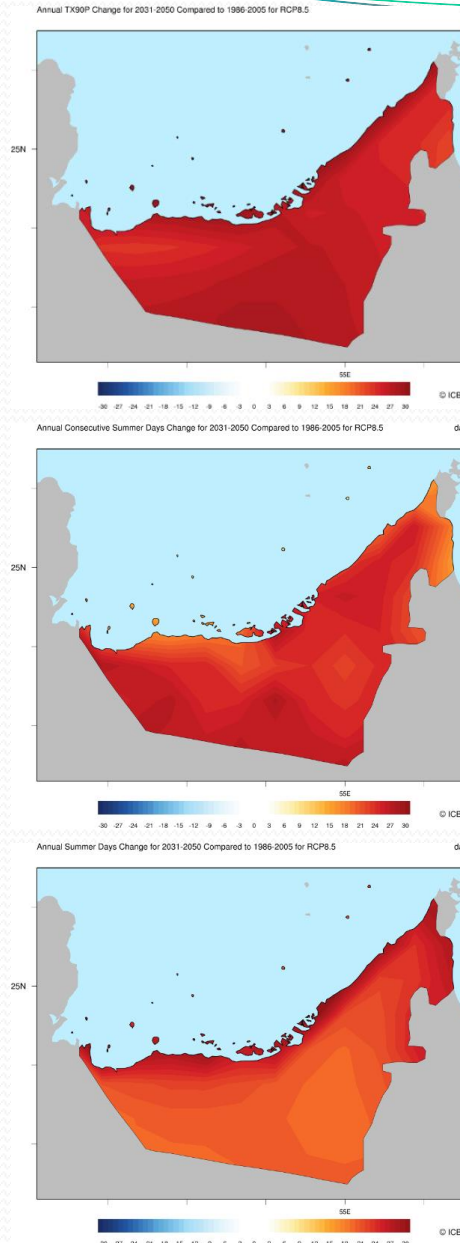

# Temperature related indices

Trend in very warm days percent ( $T > 90^{\text{th}}$  percentile of 1986-2005)

Trend in highest number of consecutive summer days ( $T > 35^{\circ}\text{C}$  compared to 1986-2005)

Trend in number of summer days ( $T > 35^{\circ}\text{C}$  compared to 1986-2005)

# Implications for water sources and consumption – a balanced policy

2020- Demand by Type (10 BCM)

2060 Demand by Type- Integrated Policy (9.8 BCM)

■ Ag ■ Indoor ■ Outdoor

2020 Supply by Source

2060 Supply by Source– Integrated Policy

■ GW ■ Reuse ■ MED ■ MSF ■ RO

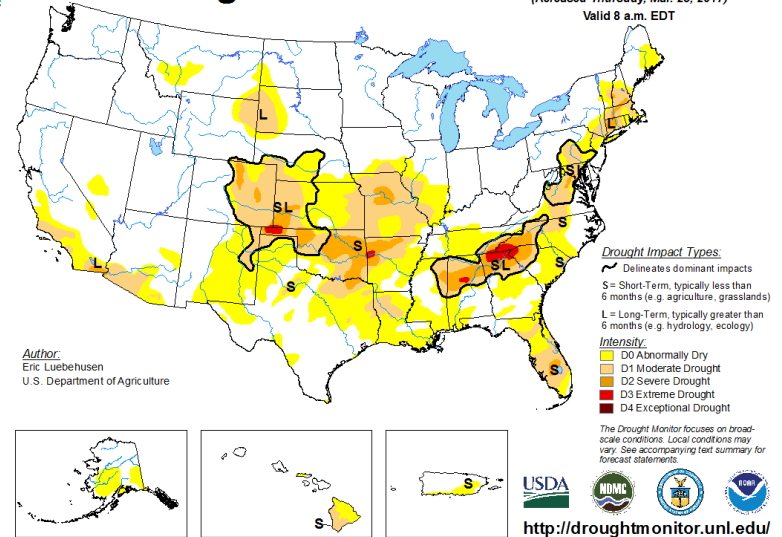

# Droughts - key stress

- Aridity stressed during droughts
- No drought monitoring or management in place
- Will not be able to irrigate out of this in the future

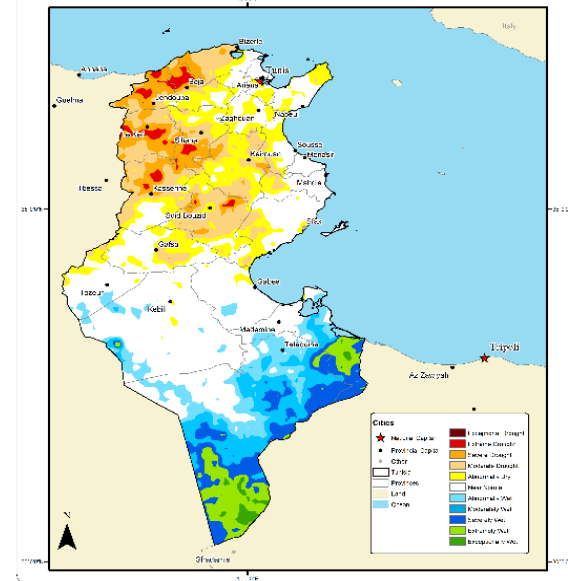

## U.S. Drought Monitor

March 21, 2017  
(Released Thursday, Mar. 23, 2017)  
Valid 8 a.m. EDT

## Tunisia Composite Drought Index

January 2008

# What innovations are needed in demand management?

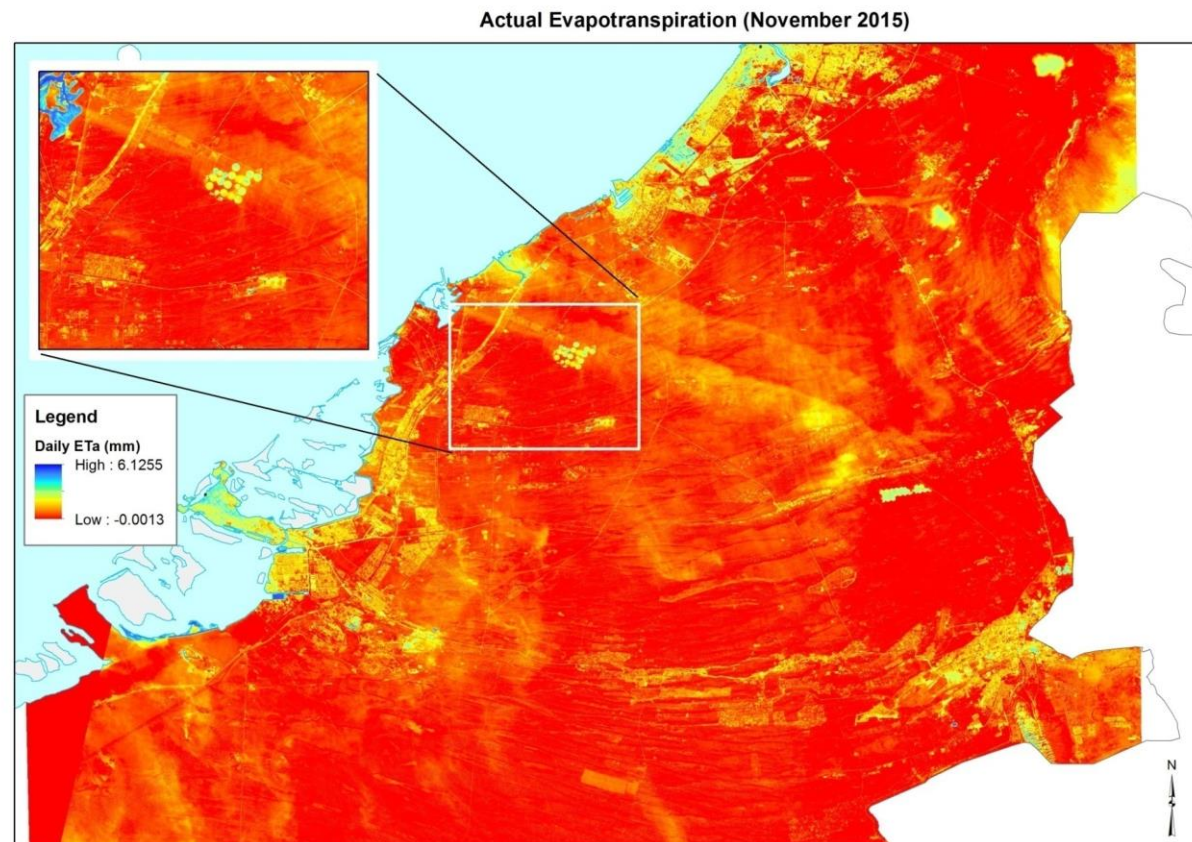

- The way food is grown
- The way we view our landscapes

# What innovations are needed in demand management?

- Water efficiency needs to be greatly improved
- ETa modeling can support water accounting approach

# What innovations are needed in supply?

- Desal and Treated waste water key so technologies managing salinity
- Processing to ensure safety and consumer trust
- The types of water we use where
  - Saline
  - Produced water
  - TWW
  - RO Brine effluent

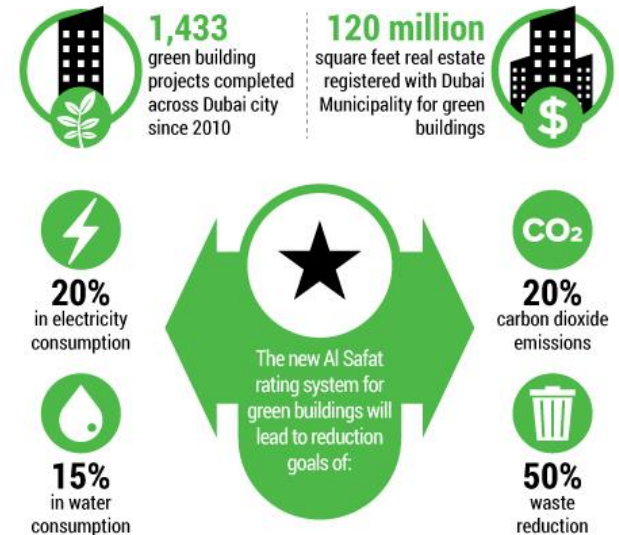

# Greatest innovations in policy and law/regulation

- How can we guide user behavior?
- Groundwater governance needs to be effective AND implemented if strategic reserves are to be protected
- Regulations to enhance TWW use
- Do we need to price water differently?
- Urban development offers great opportunity – green building codes

## In numbers

# Climate smart water management can be win-win

- Growing awareness and acknowledgement of a changing climate across many different users and demographics
- Green technologies are being boosted and more accessible to all
- Challenging our ideas as to the way food is grown
- Encourages integrated thinking – water – energy-food

# Credits and Thanks

- Karim Bergaoui, Makram Belhaj Fraj, Giulio Caroletti  
Rashyd Zaaboul
- USAID grants – MAWRED and MENA RDMS
- Islamic Development Bank and Govt of UAE

# A unique Center of Excellence looking at Agriculture for Tomorrow

## Thank you
