Outlines

- Introduction
- Process description
- Thermal analysis
- System performance and model validity
- Sensitivity analysis
- Conclusions.
Introduction

* Several ME-TVC desalination units have been installed recently in most of the GCC countries.

* The total installed capacity has increased up to 500 MIGD in the last decade.

Fig. 1 The unit size capacities of these units were increased exponentially from 1 to 8.5 MIGD in a very short period.
* The unit size capacity is available at 10 MIGD, and it is expected to increase up to 15 MIGD in the near future.

* The new trend of combining ME-TVC with conventional multi-effect unit led to this increase in the unit size.
* Limited studies were carried out ME-TVC from exergy point of view since the mid of nighties, but it has been published in several works recently.

* A mathematical model of ME-TVC is developed in this study, using EES Software.

* This model is used to evaluate the system performance of some new commercial units having capacities of 2.4, 3.5 and 6.5 MIGD.
Fig. 2 Two identical ME-TVC units are combined with a single ME unit.
**Thermal analysis**

* First and Second Laws analyses are used to develop a mathematical model of the system.

* Mass, energy and exergy balance is applied to the thermo-compressors, evaporators, feed heaters and end condenser.

* Assumptions:
  - Steady state operation,
  - Negligible heat losses to the surrounding,
  - Equal temperature difference across effects & feed heaters,
  - The variations of $C_p$ & $BPE$ with the $T$ and salinity are negligible.
* Energy balance is applied to each evaporator in ME-TVC units, in order to find:

\[
D_1 = \frac{(D_s + D_r) \cdot (h_d - h_{fd})}{L_1} - F_1 \cdot C \cdot \left( \frac{T_1 - T_{f1}}{L_1} \right)
\]

\[
D_2 = \left( D_1 + D_r \cdot y - F_1 \cdot y \right) \cdot \frac{L_1}{L_2} + B_1 \cdot \frac{C \cdot \Delta T}{L_2} - F_2 \cdot C \cdot \left( \frac{T_2 - T_{f2}}{L_2} \right)
\]

\[
D_j = \left[ (D_{j-1} + \sum_{i=1}^{j-2} (D_i + D_r) \cdot y - (j-1) \cdot F_j \cdot y) \right] \cdot \frac{L_{j-1}}{L_j} + B_{j-1} \cdot \frac{C \cdot \Delta T}{L_j} - F_j \cdot C \cdot \left( \frac{T_j - T_{fj}}{L_j} \right)
\]
* Energy balance is applied to each evaporator in MED unit, in order to find:

\[ D_{j+1} = 2 \cdot D_f \cdot \frac{L_j}{L_{j+1}} + 2 \cdot B_j \cdot \frac{C \cdot \Delta T}{L_{j+1}} - F_{j+1} \cdot C \cdot \frac{(T_{j+1} - T_{fj+1})}{L_{j+1}} \]  

\[ D_{j+2} = \left( D_{j+1} + \sum_{i=1}^{j} (D_i + D_r) \cdot y - (j + n) \cdot F_{j+2} \cdot y \right) \cdot \frac{L_{j+1}}{L_{j+2}} + 2 \cdot B_{j+1} \cdot \frac{C \cdot \Delta T}{L_{j+2}} - F_{j+2} \cdot C \cdot \frac{(T_{j+2} - T_{fj+2})}{L_{j+2}} \]  

\[ D_n = \left[ (D_{n-1} + \sum_{i=1}^{n-2} (D_i + D_r) \cdot y - (j + n - 1) \cdot F_i \cdot y) \right] \cdot \frac{L_{n-1}}{L_n} + 2 \cdot B_{n-1} \cdot \frac{C \cdot \Delta T}{L_n} - F_i \cdot C \cdot \frac{(T_n - T_f)}{L_n} \]  

* The total distillate output from all effects is equal to

\[ D = 2 \cdot \sum_{i=1}^{j} D_i + \sum_{j+1}^{n} D_{j+1}, \quad i = 1, 2, \ldots, 3 \]
* Exergy balance is conducted to the thermo-compressors, evaporators, condenser and the leaving streams to find the exergy destruction (I):

\[ I = T_o \cdot \Delta S = E_{in} - E_{out} \]

**Thermo-compressor**

The exergy destruction in the thermo-compressors

\[ I_{ej} = D_s \cdot [(h_s - h_d) - T_o \cdot (S_s - S_d)] - D_r \cdot [(h_d - h_{gj}) - T_o \cdot (S_d - S_{gj})] \]
Effects
The exergy destruction in the first, second and last effect

\[ I_{e1} = (D_s + D_r) \cdot [(h_d - h_{fd}) - T_o \cdot (S_d - S_{fd})] - D_1 \cdot L_1 \left(1 - \frac{T_o}{T_{vl}}\right) - F_1 \cdot C \cdot \left[(T_1 - T_{f1}) - T_o \cdot \ln\left(\frac{T_1}{T_{f1}}\right)\right] \]

\[ I_{e2} = (D_1 + D_r \cdot y - F_2 \cdot y) \cdot L_1 \left(1 - \frac{T_o}{T_1}\right) + B_1 \cdot C \cdot \left[\Delta T - T_o \cdot \ln\left(\frac{T_1}{T_2}\right)\right] - D_2 \cdot L_2 \left(1 - \frac{T_o}{T_2}\right) - F_2 \cdot C \cdot \left[(T_2 - T_{f2}) - T_o \cdot \ln\left(\frac{T_2}{T_{f2}}\right)\right] \]

\[ I_{en} = \left[ D_{n-1} + \sum_{i=1}^{n-2} (D_i + D_r) \cdot y - (j + n - 1)F_i \cdot y \right] \cdot L_{n-1} \left(1 - \frac{T_o}{T_{n-1}}\right) + 2 \cdot B_{n-1} \cdot C \cdot \left[\Delta T - T_o \cdot \ln\left(\frac{T_{n-1}}{T_n}\right)\right] - D_n \cdot L_n \left(1 - \frac{T_o}{T_n}\right) - F_i \cdot C \cdot \left[(T_n - T_f) - T_o \cdot \ln\left(\frac{T_n}{T_f}\right)\right] \]
Condenser and Leaving Streams

* The exergy destruction in the condenser,

\[
I_c = D_n \cdot L_n \cdot \left(1 - \frac{T_o}{T_n}\right) - M_c \cdot C \cdot \left[(T_f - T_c) - T_o \cdot \ln\left(\frac{T_f}{T_c}\right)\right]
\]

* The leaving streams, \(D_r, D_f\) and \(B_n\) can be expressed as:

\[
I_{D_r} = D_r \cdot C \cdot \left[(T_{vj} - T_c) - T_o \cdot \ln\left(\frac{T_{vj}}{T_c}\right)\right]
\]

\[
I_{D_f} = D_f \cdot C \cdot \left[(T_{vj} - T_c) - T_o \cdot \ln\left(\frac{T_{vj}}{T_c}\right)\right]
\]

\[
I_{Bn} = D_n \cdot C \cdot \left[(T_n - T_c) - T_o \cdot \ln\left(\frac{T_n}{T_c}\right)\right]
\]
The heat transfer area of each effect can be obtained from the latent heat of condensation (thermal load).

\[ Q = U_e \cdot A_e \cdot \Delta T_e \]

* heat transfer area for the 1\(^{st}\), 2\(^{nd}\) and last effect

\[ A_{e1} = \frac{(D_s + D_r) \cdot [h_d - h_{fd}]}{U_{e1} \cdot (T_d - T_1)} \]

\[ A_{e2} = \frac{(D_1 + D_r \cdot y - F_1 \cdot y) \cdot L_1}{U_{e2} \cdot (T_{v1} - T_2)} \]

\[ A_n = \frac{[(D_{n-1} + \sum_{i=1}^{n-2} (D_i + D_r) \cdot y - (j + n - 1) \cdot F_i \cdot y] \cdot L_{n-1}}{U_{en} \cdot (T_{vn-1} - T_n)} \]
System performance

* The system performance of the ME-TVC model can be evaluated in terms of:

Gain output ratio

\[ GOR = \frac{D}{D_s} \]

Specific heat consumption

\[ Q_d = \frac{D_s \cdot L_s}{D} \]

Specific exergy destruction

\[ I_t = \sum \frac{I_i}{D} \]

Specific heat transfer area

\[ \frac{A_{t_d}}{D} = 2 \cdot \sum_{i=1}^{j} \frac{A_{ei}}{D_i} + \sum_{j+1}^{n} \frac{A_{ei}}{D_i} + \sum_{i=1}^{n-2} \frac{A_{fi}}{D_i} + \frac{A_c}{D} \]

Specific exergy consumption

\[ A_d = \frac{D_s}{D} \cdot \left[ (h_s - h_{fd}) - T_o \cdot (S_s - S_{fd}) \right] \]
Model Validity

* The validity of the model was tested against some available data of commercial units having different capacities:

- ALBA in Bahrain 2.4 MIGD,
- Umm Al-Nar in UAE 3.5 MIGD
- Al-Jubail in KSA 6.5 MIGD.

* The results showed good agreements

Sensitivity analysis

* A sensitivity analysis is carried out to investigate the system performance variations of Al-Jubail unit.

* This project belongs to Marafiq Company and it is currently considered as the largest ME-TVC plants in the world, (176 MIGD).

Hybrid desalination system is introduced in Al-Fujairah project (large ME-TVC units of 8.5 MIGD with RO).
Fig. 12 The decrease in the water cost in the last decade (ME-TVC).
Conclusions

* The new trend of combining ME-TVC unit with a conventional MED unit has been used lately in several large projects. This trend provides an approach to increase the unit capacity with a more compact design.

* Exergy analysis shows that the specific exergy destruction in ALBA unit is almost twice that in Umm Al-Nar and Al-Jubail units because high motive pressure is used in ALBA compared to low motive pressure in other units.

* The analysis indicates that thermo-compressors and the effects are the main sources of exergy destruction in these units.

* The first effect of Al-Jubail was found to be responsible for about 31% of the total effects exergy destruction compared to 48% in ALBA and 36% in Umm Al-Nar.
* The specific exergy destruction can be reduced by increasing the number of effects as well as working at lower top brine temperatures.

* The manufacturer tried to increase the number of effects gradually (4, 6, 8, etc.) in order to increase the size of the units in a compact design.

* Most of the new ME-TVC units are commonly operated with large combined cycle power plants in order to reduce the power and water cost.
THANK YOU
