

APPLICATION OF 2D EARTH RESISTIVITY IMAGING TOMOGRAPHY AND GIS FOR THE SUSTAINABLE MANAGEMENT OF WATER RESOURCES IN NORTHERN EMIRATES

A.M. Ebraheem

Professor of Hydrogeology, Assiut University, EGYPT

Currently: Senior Geophysicist, Ministry of Environment and Water, UAE

Introduction

- ❖ The availability of water in the right quantities and quality as well as the proper management of this precious resource are essential for the sustainable social and economical development.
- ❖ Successful Management of WR depends largely upon:
 1. the precise knowledge of the available WR
 2. the capability of predicting the impact of a certain management option

Challenges of the Sustainable Management of Water Resources in the Arid Regions

- ❖ Unavailability of complete, well- documented spatially and temporarily varied environmental data 
- ❖ Need for integrated Water resources management with EIA for each engineering project 
- ❖ Scarcity of fresh water resources in the Middle East Area 
- ❖ **Groundwater Depletion:** The ever increasing demand for water has increased groundwater exploitation rates from non-replenished and replenished aquifers causing severe groundwater depletion and saltwater intrusion problems

Groundwater depletion and saltwater intrusion in the Quaternary Aquifer, (Northern Emirates)

Solutions to Water Scarcity and Groundwater Depletion Problems

Precise knowledge of the quantity and quality of available water resources

- ❖ Exploration and evaluation of groundwater aquifers
- ❖ Rainfall harvesting and artificial groundwater recharge
- ❖ Application of surface geophysical and solute transport model techniques for monitoring and modeling saltwater intrusion

Groundwater Exploration for Solving the 1999-2004 Drought Impact on Khatt Springs, RAK

- ❖ The most interesting feature of these springs is the high temperature of the water about 39 C° as compared with a range of 25- 32 C° for all other groundwater in the northern Emirates. TDS of the spring water is less than 1500 mg/l
- ❖ In 1979, the northern spring was developed and it has been used for recreation purposes. Outflow from the pools are drained into channels and falajs to supports a substantial cultivation of date palms and other market produce

Conclusions

- ❖ Yes we have a water scarcity (severe groundwater depletion) problem, but with our full cooperation, the solution is possible:
- ❖ **International Solutions**
 - Due to groundwater depletion problem, groundwater type in shallow aquifer in the arid region is continuously changing from fresh to brackish type. According to FAO data, about 40% of the World is affected by salinization in some form or other.
 - Under these circumstances we should seriously consider cultivating halophytes (as source of food, animal feed, vegetable oil, chemical and other raw materials) to utilize saline soil and save freshwater resources.

Home

Forward

Backward

End

Conclusions

❖ International Solutions

- We should learn from the past mistakes in dealing with our freshwater resources and use the present GIS and mathematical modeling capabilities to develop a sustainable and integrated management schemes for our brackish and even saline water resources in the coastal and inland sabkhas areas.
- Full Cooperation between Trans boundary aquifer Countries in terms of sharing data, formalizing well documented GIS databases and complying with the sustainable extraction rates.
- Scientific and Political efforts are always needed.

Conclusions

❖ National Solutions

- Improving our Irrigation System ..
- Re-use of drain water is encouraged but ..
- All possible ways of water conservation must be applied
- Exploration and utilization of groundwater resources in many areas are encouraged but we have always to keep in mind their sustainability.
- Improving our monitoring network is crucially needed.
- Improving our prediction capabilities using mathematical models and GIS
- Train scientists in our research institutions about orienting their research efforts toward solving their community problems. One important step in this goal is writing “good and convincing proposals” for financial support
